EXPERIMENT – 1

NAME: I MOHAMMED HAMZA

ROLL NO.:240701326

1) CHUNKING

1. Chunking

Breaking down lots of info into smaller groups

Example:

- Pizza & Italian (25 restaurants)
- Burgers (18 restaurants)
- Asian Food (32 restaurants)
- Healthy (12 restaurants)

Instead of showing 87 random restaurants, we group them. Easier to browse!

What is Chunking?
Chunking is a cognitive design principle that involves breaking down large amounts of information into smaller, related groups or "chunks." This helps the brain process and remember information more efficiently by reducing cognitive load.

Visual Example from Food Delivery Apps:
Instead of overwhelming users with a single, endless list of 87 restaurants, the app organizes them into clear, visually distinct categories such as:

- Pizza & Italian (25 Restaurants)
- Burgers & Fast Food (18 Restaurants)
- Asian Food (32 Restaurants)
- Healthy & Salads (12 Restaurants)

Why Does Chunking Work?

- Reduces Mental Effort: Users don't have to scan through every option.

- Improves Navigation: Categories act as signposts, guiding users to what they want.
- Enhances Memory Retention: Grouped items are easier to recall later.
- Boosts User Confidence: Clear organization makes the app feel intuitive and trustworthy.

Real-World Application:
Just like a supermarket organizes items into aisles (dairy, snacks, beverages), a food app chunks restaurants and menu items into logical groups for seamless browsing.

2)RECOGNITION

2. Recognition

Using pictures/icons so you don't have to remember stuff

Example:

McDonald's logo - you know it right away

Food photos - see what it looks like

⭐⭐⭐⭐ Stars - quick way to see if it's good

You recognize the logo/picture faster than reading text

What is Recognition?
Recognition is the ability to identify something you've seen before when it is presented again. In UI design, this means using visual cues—like icons, logos, and images—so users can "recognize" rather than "recall" information.

Visual Example from Food Delivery Apps:

- Brand Logos: The McDonald's golden arches, Dominos logo, or Starbucks mermaid are instantly recognizable.
- Food Photos: High-quality images of dishes help users visualize what they're ordering.
- Star Ratings: A 5-star rating is immediately understood as "highly recommended."

- "Popular" or "Bestseller" Badges: Visual tags draw attention to top choices.

Why Does Recognition Work?

- Speeds Up Decision-Making: Users don't need to read descriptions—they recognize items at a glance.
- Reduces Errors: Visual confirmation helps avoid ordering the wrong item.
- Engages Emotionally: Appetizing photos and familiar logos create a connection.
- Lowers Cognitive Load: Recognition is easier than recall because the information is right in front of the user.

Real-World Application:
Think of walking into a coffee shop and recognizing your usual order by its image on the menu board—no need to remember the exact name.

3)RECALL

3. Recall

App remembers things for you

Example:
- "Order Again" button - your last pizza order saved
- Favorites 💗 - save restaurants you like
- Recent searches saved automatically
- Order history shows everything you ordered before

You don't have to remember what you ordered last week - the app does it for you

What is Recall?
Recall is the ability to retrieve information from memory without external cues. In app design, this is supported by features that "remember for the user," reducing the mental effort required to repeat actions.

Visual Example from Food Delivery Apps:

- "Order Again" Button: Instantly reorders your last meal with one tap.
- Saved Favorites: A list of your most-loved restaurants and dishes.
- Recent Searches: Quick access to what you were looking for earlier.
- Order History: A complete log of every past order, including details like date, items, and total cost.

Why Does Recall Support Work?

- Saves Time: No need to manually search for past orders.
- Reduces Friction: Makes repeat ordering effortless and fast.
- Builds Habit: Encourages users to return to the app regularly.
- Personalizes Experience: The app feels "smart" and attentive to user preferences.

Real-World Application:
It's like having a friend who remembers your favorite pizza topping—you don't have to tell them every time.
