EXPERIMENT 6

Experiment with Different Layouts and Color Schemes using GIMP

AIM:

To design a mobile app interface using GIMP and experiment with different color schemes to evaluate aesthetics and usability.

TOOLS REQUIRED

- GIMP (GNU Image Manipulation Program)
- Computer System

PROCEDURE

Step 1: Installation of GIMP

- GIMP was downloaded from the official website and installed.
- The application was launched successfully.

Step 2: Creating a New Canvas

- A new project was created using **File → New**.
- The canvas size was set to **1080 × 1920 pixels** to simulate a mobile screen.

Step 3: Designing the Base Layout

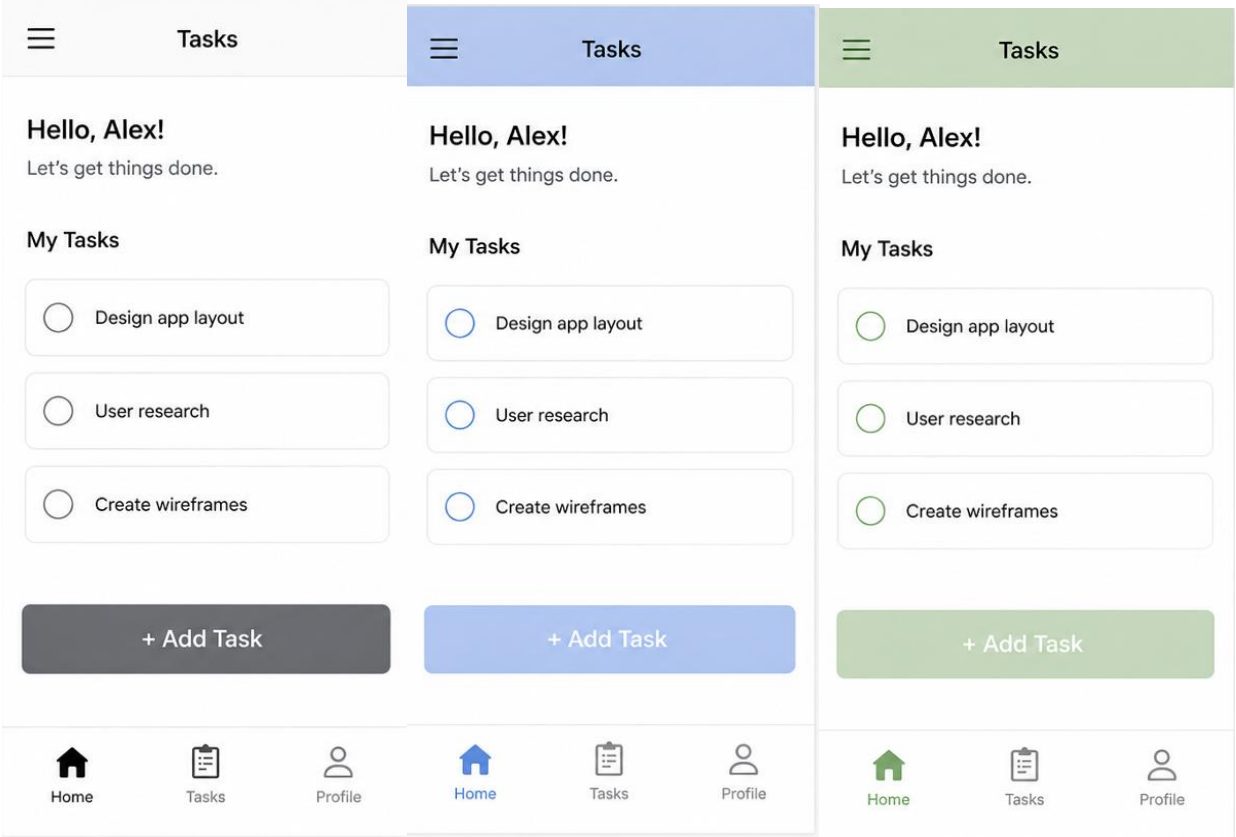
- The layout of a simple task management app was created.
- The screen was divided into:

    - Header (Title: Tasks)
    - Content section (My Tasks)
    - Footer (Navigation bar)
- Basic UI structure was created using rectangle selection and fill tools.

Step 4: Adding UI Elements

- Text elements like:
    - “Hello, Alex!”
    - “My Tasks”
- Task items were added with circular checkboxes:
    - Design app layout
    - User research
    - Create wireframes
- A button **“+ Add Task”** was added.
- Navigation icons (Home, Tasks, Profile) were placed at the bottom.
- Layers were used to organize elements properly.

Step 5: Applying Color Variations



Three versions of the same layout were created:

1. **Grey Theme (Left)** – minimal and neutral design
2. **Light Blue Theme (Center)** – calm and modern appearance
3. **Light Green Theme (Right)** – fresh and clean look

Step 6: Collecting User Feedback

- The three designs were shown to users.
- Feedback was collected based on:
  - Visual appeal
  - Readability
  - Ease of use

Step 7: Analysis

- Most users preferred the **light blue and green themes**.
- The grey theme was considered simple but less attractive.

RESULT

A mobile app interface with three different color schemes was successfully designed using GIMP. The experiment showed that color significantly affects user perception and usability.
